What is a boost inverter?

The new inverter is intended to be used in uninterruptible power supply (UPS) and AC driver systems design whenever an AC voltage larger than the DC link voltage is needed, with no need of a second power conversion stage. This paper proposes a new voltage source inverter (VSI) referred to as a boost inverter or boost DC-AC converter.

What is a boost converter?

A boost converter, also known as a step-up converter, is a DC-to-DC power converter with an output voltage greater than its input voltage. It is a class of switched-mode power supply (SMPS) containing at least two semiconductors (a diode and a transistor) and at least one energy storage element, such as a capacitor or inductor, or the two in combination.
