

# **Continue to promote new energy storage**

## Overview

---

Will China develop new energy storage systems between 2025 and 2027?

BEIJING, Sept. 12 -- China on Friday unveiled an action plan to promote the development of new forms of energy storage between 2025 and 2027, amid efforts to support green energy transition and ensure the stability of new-type power systems.

Why is China moving to a new type of energy storage?

The move is part of China's broader push toward a green, low-carbon energy transition as well as high-quality economic and social development. It builds on significant growth in the sector. As of the end of 2024, the country's installed capacity of new-type energy storage had reached 73.76 million kilowatts, according to official data.

How can we make energy storage more reasonable?

One way to approach making energy storage more reasonable is to make sure it's renewable and ethically sourced. One company working on such a solution is Tesla. They are creating batteries that use less cobalt, a material that often comes from mines in the Democratic Republic of Congo that use child labor.

What is next-generation energy storage?

Next-generation energy storage systems are based on novel chemistries, such as all-solid-state, Li metal, Li-sulfur, and metal-oxygen, to achieve significantly higher energy density. These batteries may use materials and their interfaces as key limiting factors and origins of failures.

## Continue to promote new energy storage
