

Differences between different types of cylindrical lithium batteries

Overview

What are the different types of lithium ion batteries?

There are three main types of lithium-ion batteries (li-ion): cylindrical cells, prismatic cells, and pouch cells. In the EV industry, the most promising developments revolve around cylindrical and prismatic cells.

What are the different types of lithium battery packaging?

There are three main mainstream lithium battery packaging forms, namely cylindrical, prismatic, and lithium polymer. The three shapes of lithium batteries will eventually become cylindrical batteries, prismatic batteries and lithium polymer batteries through cylindrical winding, prismatic winding, and prismatic lamination.

What are the different types of cylindrical batteries?

Cylindrical batteries are divided into lithium iron phosphate, cobalt oxide, manganate, cobalt oxide, and ternary systems. The shell is divided into two types: steel shell and polymer. Batteries with different material systems have different advantages. At present, cylindrical batteries are mainly steel-cased cylindrical lithium iron phosphate.

What is the difference between a prismatic and a lithium polymer battery?

The biggest difference between lithium polymer, cylindrical, and prismatic batteries is that their outer casing is made of aluminum-plastic film. The pouch battery itself is lighter. With the same capacity, its weight is 20% lighter, and its capacity is 50% higher than that of prismatic batteries.
