

Electrochemical energy storage promotes dual carbon economy

Overview

Electrochemical energy storage and conversion (EESC) devices, that is, batteries, supercapacitors, and fuel cells, play a central role in addressing these challenges because EESC is the core enabling technology toward transport electrification, hydrogen economy, and efficient utilization of renewable energy. What is a dual-carbon electrochemical energy storage device?

Dual-carbon electrochemical energy storage device Apparently, although the types of anion and cation that can be used for energy storage on carbon-based electrodes are abundant, the energy storage mechanisms can be classified just into adsorption/desorption and intercalation/de-intercalation.

Can a dual-carbon energy storage device be used as an anode or cathode?

Herein, we extend the concept of dual-carbon devices to the energy storage devices using carbon materials as active materials in both anode and cathode, and offer a real-time and overall review of the representative research progress concerning such generalized dual-carbon devices.

Are dual-carbon batteries and supercapacitors a promising electrochemical energy storage device?

Propose new insights for the future research directions and challenges of the dual-carbon devices. Dual-carbon based rechargeable batteries and supercapacitors are promising electrochemical energy storage devices because their characteristics of good safety, low cost and environmental friendliness.

How do high-concentration electrolyte-based dual-carbon devices work?

Moreover, high-concentration electrolytes can also be used to weaken concentration fluctuation caused by ions participating in energy storage in the electrolyte. In short, the design and energy storage mechanism of high-concentration electrolyte-based dual-carbon devices remains to be further studied and expanded.
