

Is it better for solar panel inverters to be bigger

Overview

Do solar panels need a larger inverter?

In the past, virtually all solar systems featured panels and an inverter of equal capacity. Now many installers recommend having an array of panels with a holding power larger than that of your inverter. This is called inverter oversizing.

How does a solar inverter affect efficiency?

The efficiency of the inverter drives the efficiency of a solar panel system. Inverters change the Direct Current (DC) from solar panels into Alternating Current (AC), which is what we use in our homes and businesses. This article talks about how to pick the right size solar inverter.

How do I choose a solar inverter size?

To calculate the ideal inverter size for your solar PV system, you should consider the total wattage of your solar panels and the specific conditions of your installation site. The general rule is to ensure the inverter's maximum capacity closely matches or slightly exceeds the solar panel array's peak power output.

Should a solar inverter be oversized?

However, slight over-sizing of the solar panels compared to the inverter capacity (up to 133% under certain guidelines) can sometimes yield better overall efficiency due to the variable nature of solar irradiation throughout the day. The ratio for inverter sizing often depends on specific system requirements and local regulations.
