

Outdoor power upgrade fast charging

Overview

Can EV charging stations support ultrafast charging?

For future charging stations without sufficient power capacity, we investigate two generalized solutions that can help manage the load increase: dynamic waiting for EV charging and use of energy storage. Lastly, we discuss the costs of different upgrade strategies for fast-charging stations to support ultrafast charging.

How will China's EV fast-charging power impact the power grid?

In China, electric vehicle (EV) fast-charging power has quadrupled in the past five years, progressing toward 10-minute ultrafast charging. This rapid increase raises concerns about the impact on the power grid including increased peak power demand and the need for substantial upgrades to power infrastructure.

Why do charging stations need more Chargers?

Two reasons explain this: ① Charging stations with more chargers usually have a higher total power capacity, which helps deal with high-power charging; and ② more chargers can handle more charging sessions and thus provide more flexibility for dynamic adjustments.

How can airport EV charging station satisfy ultrafast charging demands?

It is noteworthy that if a total power capacity of 120 kW (under C2) times the charger number is provided, the airport EV charging station can satisfy the ultrafast charging demands from S1 to S7 by using only the dynamic waiting strategy.
