

Power supply from power station generator

Overview

What is the difference between a power station and a generator?

The terms power station and generator are often used interchangeably, but they refer to distinct components within the electrical power supply system. Understanding the differences between a power station and a generator is crucial for industries, engineers, and consumers relying on consistent electricity.

What does a power station do?

Power stations serve as the backbone of modern electricity supply systems, delivering high-voltage electricity to substations that distribute power to homes, businesses, and industries. Unlike smaller generators, power stations are designed for continuous operation with high capacity output.

What is a portable power station?

Portable power stations, also called gasless generators, store electrical power in an internal battery that must be recharged.

What is the voltage level of a generating station?

Do not put much attention to this diagram as I am going to make it easy for you in further discussion. At generating station power is generated at voltage level of around 11kV (in some case it is higher as 16.5kV or 25kV). To Transmit this power over long distances, we need higher voltage level so that we can send power with minimum losses.
