

Solar street light circuit

Overview

What is a solar street light circuit diagram?

A basic solar street light circuit diagram consists of the following components: a solar panel, controller, battery, LED, and voltage regulator. Each component is essential for a working system. The solar panel is the most integral part of the system. It absorbs the energy from the sun and converts it into usable electricity.

Can we make a small Solar street light circuit?

In some places, there is no AC mains power available, right. So, in such cases, we cannot use AC mains based street light circuits. That's where a solar-powered automatic LED street light system becomes a smart solution, right. So now the 3rd circuit design below shows how we can make a small solar street light circuit using very few parts.

How does a solar street light system work?

Now this automatic solar street light system, that is basically a system that checks surrounding light condition and then switches ON or OFF an attached lamp all by itself, depending on how much light is there around, right.

What is a solar powered street lamp?

A solar powered street lamp is novel because it can be off-grid and still functioning in case of power outages. It also leaves power to be available for other purposes. The "smart" portion of the street light allows it to automatically illuminate when it detects the presence of a moving body.
