

# **Working principle of base station solar container power supply system**

## Overview

---

By installing solar photovoltaic panels at the base station, the solution converts solar energy into electricity, and then utilizes the energy storage system to store and manage the electricity, ensuring 24-hour uninterrupted power supply for the 5G base station. Can partial backup energy storage be integrated into grid dispatch?

Furthermore, references [13, 14] propose the integration of partial backup energy storage in base stations into grid dispatch, resulting in increased economic benefits of base stations and improved stability of the distribution network. However, on one hand, optimization of base station operating modes have limited ability to reduce energy demands.

How ESS is connected to a base station?

Scheme 1: The classic scheme in which the base stations are only powered by grid electricity. Scheme 2: The PV modules are connected in series to obtain higher voltage and are connected to the AC bus of the base station through an inverter with MPPT function. ESS is connected to the 48 V DC bus through bidirectional DC/DC converter.

Can distributed photovoltaic and energy storage systems reduce energy consumption?

Numerous studies have affirmed that the incorporation of distributed photovoltaic (PV) and energy storage systems (ESS) is an effective measure to reduce energy consumption from the utility grid.

Does converter behavior affect base station power supply systems?

The influence of converter behavior in base station power supply systems is considered from economic and ecological perspectives in this paper, and an optimal capacity planning of PV and ESS is established. Comparative analyses were conducted for three different PV access schemes and two different climate conditions.
